Thank you for choosing this Keeler product.

Please read this manual carefully before using your Keeler Slit Lamp, this will ensure the safety of the patient and ensure you get the best performance from this precision optical device.
2 SYMBOLS USED IN THESE INSTRUCTIONS FOR USE AND THE SLIT LAMP PACKAGING

- Manufacturer’s name and address
- Mandatory action sign
- Follow Instructions for Use
- Optical radiation hazard
- Warning: Dangerous Voltage
- Trip Hazard
- Hot surface
- General warning sign
- Type B Applied Part
- Non-ionizing radiation
- Keep dry

- REF Reference Number
- SN Serial Number
- Date of manufacture
- The CE mark on this product indicates it has been tested to and conforms with the provisions noted within the 93/42/EEC Medical Device Directive
- This way up
- Material suitable for recycling
- Fragile
- The symbol on the Product or on it’s Packaging and instructions indicates it was put on the market place after August 2005 and this product shall not be treated as Household Waste
- Operating Instructions
3 INDICATIONS FOR USE

This Keeler Slit Lamp is an AC-powered slit lamp biomicroscope and is intended for use in eye examination of the anterior eye segment, from the cornea epithelium to the posterior capsule. It is used to aid in the diagnosis of diseases or trauma which affects the structural properties of the anterior eye segment.

This device is intended to be used only by suitably trained and authorised healthcare professionals.

Caution: Federal Law restricts this device to sale by or on the order of a physician or practitioner.

4 INTENDED USE / PURPOSE OF INSTRUMENT

The Slit Lamp is an instrument consisting of a light source that can be focused to shine a thin sheet (slit) of light into the eye. It is used in conjunction with a biomicroscope. The lamp facilitates an examination of the anterior segment, or frontal structures and posterior segment, of the human eye, which includes the eyelid, sclera, conjunctiva, iris, natural crystalline lens, and cornea. The binocular Slit Lamp examination provides stereoscopic magnified view of the eye structures in detail, enabling anatomical diagnoses to be made for a variety of eye conditions.

5 BRIEF DESCRIPTION OF THE INSTRUMENT

This Keeler Slit Lamp can either be mounted onto a custom table top supplied by Keeler or can be mounted on a third parties table top (refraction unit) by suitably trained technicians.

The Keeler Slit Lamp consists of 5 assemblies; Illumination Tower; Observation System; XYZ Translation Base; Chinrest Assembly and a Table Top with Power Supply and Accessory Drawer.

The light intensity is controlled by a variable rheostat located on the XYZ Translation Base. There are a number of selectable filters allowing the user to control the characteristics of the examination light.

The 'CE' (European Community) mark attests that the Keeler Slit Lamp complies with the provisions of the EC Directive 93/42/EEC.

Classification: CE Regulation 93/42 EEC: Class I
FDA: Class II
IEC/EN Standard 60601-1: H-series - Safety Class II
Application part: Type B
Operation mode: continuous operation

Production processes, testing, start-up, maintenance, and repairs are conducted in strict conformity with the applicable laws and international reference standards.
6 SAFETY

6.1 PHOTO TOXICITY

Because prolonged intense light exposure can damage the retina, the use of the device for ocular examination should not be unnecessarily prolonged, and the brightness setting should not exceed what is needed to provide clear visualization of the target structures. This device should be used with filters that eliminate UV radiation (< 400 nm) and, whenever possible, filters that eliminate short-wavelength blue light (<420 nm).

The retinal exposure dose for a photochemical hazard is a product of the radiance and the exposure time. If the value of radiance were reduced in half, twice the time would be needed to reach the maximum exposure limit.

While no acute optical radiation hazards have been identified for slit lamps, it is recommended that the intensity of light directed into the patient’s eye be limited to the minimum level which is necessary for diagnosis. Infants, aphakes and persons with diseased eyes will be at greater risk. The risk may also be increased if the person being examined has had any exposure with the same instrument or any other ophthalmic instrument using a visible light source during the previous 24 hours. This will apply particularly if the eye has been exposed to retinal photography.

It is well established that exposure of the eye to intense light sources for extended periods of time poses a risk of retinal photic injury/ocular damage.

Many ophthalmic instruments illuminate the eye with intense light. The light intensity on the Keeler Slit Lamp is continuously adjustable from maximum to zero. In addition there is an infra red filter incorporated in the illumination system to reduce IR light levels.

Keeler Ltd shall on request, provide the user with a graph showing the relative spectral output of the instrument.
6.2 WARNINGS AND CAUTIONS
Observe the following prescriptions in order to ensure safe operation of the instrument

WARNINGS
• Never use the instrument if visibly damaged and periodically inspect it for signs of damage or misuse.

• Check your Keeler product for signs of transport / storage damage prior to use.

• Do not use in the presence of flammable gases / liquids, or in an oxygen rich environment.

• US Federal Law restricts this device to sale by or on the order of a physician or practitioner.

• This device is intended to be used only by suitably trained and authorised healthcare professionals.

• This product should not be immersed in fluid.

• Repairs and modifications to the instrument must be made only by the specialized technicians of the manufacturer’s Technical Service Centre or by personnel trained and authorised by the manufacturer. The manufacturer declines any and all responsibility for loss and/or damages resulting from unauthorised repairs; furthermore, any such actions will invalidate the warranty.

• Route power cords safely to eliminate risk of tripping or damage to user.

• Before any cleaning of the instrument or the base unit ensure the power lead is disconnected.

• Bulbs can reach high temperatures in use – allow to cool before handling.

• Do not exceed maximum recommended exposure time.

• Should the instrument suffer shocks (for example, should it accidentally fall), and the optical system or the illumination system are damaged it may be necessary to return the instrument to the manufacturer for repair.

• Care should be taken when handling halogen bulbs. Halogen bulbs can shatter if scratched or damaged.

• After removal of the bulb, do not touch the Slit Lamp bulb electrical contacts and patient simultaneously.

• The owner of the instrument is responsible for training personnel in its correct use.

• Ensure the instrument or instrument table is placed on a level and stable surface.

• Use only genuine Keeler approved parts and accessories or device safety and performance may be compromised.

• Shut down after every use. In case the dust cover is used: risk of overheating.

• For indoor use only (protect from moisture).

• Electrical equipment can be affected by electromagnetic interference. If this occurs whilst using this equipment, switch the unit off and reposition.

• Do not touch accessible connectors and the patient simultaneously.
7  CLEANING AND DISINFECTION INSTRUCTIONS

Before any cleaning of the instrument or the base unit, ensure the power lead is disconnected.

Only manual non-immersion cleaning as described should be used for this instrument. Do not autoclave or immerse in cleaning fluids. Always disconnect power supply from source before cleaning.

a. Wipe the external surface with a clean absorbent, non-shedding cloth dampened with a water / detergent solution (2% detergent by volume) or water / isopropyl alcohol solution (70% IPA by volume). Avoid optical surfaces.

b. Ensure that excess solution does not enter the instrument. Use caution to ensure cloth is not saturated with solution.

c. Surfaces must be carefully hand-dried using a clean non-shedding cloth.

d. Safely dispose of used cleaning materials.

8  TRANSPORT, STORAGE AND WORKING CONDITIONS

The following ambient condition limits are recommended for the Keeler Slit Lamp, for transport and storage it is recommended that the Slit Lamp is kept in its original manufacturers packaging.

WORKING ENVIRONMENT
+10°C to +35°C
30% to 75% relative humidity

TRANSPORT AND STORAGE CONDITIONS
Transport: -40°C to +70°C
Storage: -10°C to +55°C

Before use, the Slit Lamp should be allowed to adjust to the ambient room temperature for several hours. This is especially important when the unit has been stored or transported in a cold environment; this can cause severe condensation to develop on the optical elements.
9 NAMES OF CONTROLS AND COMPONENTS

HEADREST ASSEMBLY

1. Fixation light cable
2. Main lamp cable (4 pin socket)
3. Forehead rest band
4. Patient’s eye height marker
5. Fixation light
6. Chinrest
7. Chinrest height adjuster
8. Patient grab handles
9. Power lead, chinrest to lamp housing

KEELER SLIT LAMP: H SERIES

10. Lamp cover
11. Lamp cover release screws
12. Lever for grey (ND), blue, diffuser and red free filters
13. Slit length, slit rotation and aperture control
14. Scale for slit rotation

15. Illumination mirror
16. Slit offset centring knob
17. Inclination latch 5° to 20°
18. Slit width controls
19. Test bar & tonometer plate mounting hole and cover
20. Illumination arm locking knob
21. Microscope arm locking knob
22. Eyepiece assembly securing knob

23. Joystick base locking knob
24. Joystick control (X Y Z movement)
25. Illumination control rheostat

26. Axle
27. Runner covers

28. R type tonometer mounting hole
29. Yellow filter knob (up = out)
30. Lock for securing magnification body
31. Magnification change drum
32. Eyepieces – adjustable for PD and dioptre correction
33. Breath shield securing knob

34. Main power switch
35. Power supply unit
36. Glide plate
10 ASSEMBLY

Your Keeler Slit Lamp has been designed to fit on to an electric insulated medical table base or on to an electric insulated and fire resistant medical table top, e.g. a Refraction Stand or Combi Unit.

Take care when unpacking your Slit Lamp that you do not accidentally damage or discard any of the contents.

Leave the Slit Lamp in the packing for several hours after delivery before unpacking to reduce the risk of condensation forming.

Keeler Slit Lamps can be fitted to most Refraction Stands / Combi units. Keeler recommends that this be carried out by suitably trained technicians to ensure performance and safety are not compromised.

The Refraction Stand, Combi Unit or table leg must be 60601-1 3rd edition compliant

If you are fitting or have fitted your Slit Lamp to a medical or Keeler table leg/base ensure it is situated on a firm and level floor.

If the table leg/base has castors ensure the following before moving it to another location:

a) The table is at its lowest position
b) The power cord is removed
c) The slit lamp arm and base locking knobs are tightened
d) The Runner covers are securely located
e) The system is moved by grasping it at its lowest practical point.

10.1 TABLE TOP AND BASE ASSEMBLY PROCEDURE

1 Attach the Slit Lamp table top to your table leg using the M6 x 20mm CAP head fasteners and washers. Note that the power supply and accessory drawer should face the operator.

The security of the fitment of the table top to the table leg is critical for patient and Slit Lamp safety

2 Using the wrench provided, fit the Headrest Assembly to the tabletop using the hex bolts and washers. The Headrest Assembly locates on the underside of the tabletop. Take care not to over tighten the hex bolts.

3 Attach the Patient Grab Handles (8) to the Headrest Assembly.

4 Place the Slit Lamp base on the Runners. Ensure that the wheels are in line with each other. Check that the guide wheels are tight.

5 Fit the Runner covers to the Runners by gently sliding them inwards, towards each other.
10.2 ILLUMINATION TOWER ASSEMBLY PROCEDURE

1. Remove the hex bolt (a) from the base of the Illumination tower, and then place the illumination tower on the Slit Lamp base with the base notch (b) and pin (c) aligned. Attach the tower to the base using the hex bolt removed earlier and tighten using the wrench provided.

2. Carefully fit the microscope body to the arm – ensuring it is pushed to the stop. Tighten using the securing knob on the side.

3. Attach the breath shield to the pin on the rear of the magnification assembly.

10.3 CABLE ATTACHMENT PROCEDURE

1. Connect the main lamp cable from the Chinrest to the illumination tower. Do not twist the lead on the tower illumination system.

2. Connect the power cables
   a) Chinrest fixation light cable to power supply unit
   b) [3 pin] cable from power supply unit to slit lamp base assembly
   c) [4 pin] main lamp cable from bottom of the chinrest to the slit lamp base assembly.
   d) Ensure cables are routed to allow free movement of the XYZ base and to be clear of the patients.

If your Slit Lamp was not supplied with a transformer (Part #3020-P-5040, make sure that the power connection is compatible with the specifications in this manual and is connected by a qualified technician to an available and suitable power supply, see section 15.5 Power Supply.
3 Connect the mains power to the Slit Lamp transformer using the power lead provided.

Only a hospital grade 3-conductor electrical power supply cable must be used. For USA and Canada: Detachable power supply cord set, UL listed, type SJE, SJT or SJO, 3-conductor, not smaller than 18 AWG. Plug, cable and ground lead connection of the socket have to be in perfect condition.
10.4 FITTING APPLANATION TONOMETERS, T TYPE AND R TYPES

KEELER APPLANATION TONOMETER (T-TYPE)

- Position the guide plate in the tonometer/test bar support hole on the slit lamp.

- Lift Tonometer out of the packaging and assemble it by inserting the pin on its base into one of the two possible openings (for right or left eye) on the horizontal guide plate above the slit lamp axis. These positions are related to the microscope optics and observation can be made either through the right or the left eye-piece.

- The tonometer will slip easily onto the support plate; stability is assured by the locking pins.

- To obtain an image as clear and as free of reflexes as possible, the angle between the illumination and the microscope should be about 60° and the slit diaphragm should be fully opened.

- When not in use the Tonometer should be removed from the Slit Lamp and placed securely back in the packaging or a suitable location.

APPLANATION TONOMETER ‘KEELER FIXED’ (R-TYPE)

This instrument is for those who wish the tonometer to remain permanently on the slit lamp.

- Mount the plate for the tonometer onto the microscope body using the securing screw.

- Mount the tonometer mount onto the mounting post.

- Swing the Tonometer forward in front of the microscope for examination. A notch position ensures exact centring of the prism with the left objective.

- To obtain an image as clear and as free of reflexes as possible, the angle between the illumination and the microscope should be about 60° and the slit diaphragm should be fully opened.

- When not in use the instrument is swung around and secured in a notch position to the right of the microscope.
11 INSTRUCTIONS FOR USE

11.1 SETTING THE BINOCULARS

It is vital that the binoculars are optimised for the user’s optical correction in order to obtain focused binocular images.

1. Remove the Test Bar locating hole cover plate (19) and place the test bar focus in the test bar location hole at the base of the microscope arm. To access the location hole first remove the cover. The test bar should be set with the flat projection face towards the Slit Lamp Microscope. The illumination and the microscope should be in the zero degrees position.

2. Turn on the Slit Lamp, and set the slit to full width (18), set the magnification to x16 (31).

3. Adjust the eyepieces pupillary distance by holding both eyepiece bodies and rotating them inwards or outwards until they are correct for your PD.

4. Turn both eyepieces (32) to maximum plus (+) correction.

5. Close one eye, and with the other eye look through the microscope slowly turning the open eye eyepiece towards the minus (-) position until the image of the test bar is in focus. Stop.

6. Repeat the above process for the other eyepiece.

7. Make a note of the positions of the eyepieces so that you can set them quickly if the Slit Lamp has been used by another clinician.

8. Note – younger examiners are recommended to compensate for their ability to accommodate by further adjusting the eyepieces by minus one [-1] or minus two [-2] dioptres.
11.2 PREPARING THE PATIENT AND USING THE SLIT LAMP

1. The patient should be as comfortable as possible and with the patient in the chinrest adjust the chinrest height (7) so that the patient’s eyes are level with the height marking (4) on the chinrest support.

2. Focus the eyepieces using the test bar as described earlier, and if you have not already done so set them to your interpupillary distance by holding both eyepiece bodies and rotating them inwards or outwards until they are correct for your PD.

3. Switch on the illumination, making sure the rheostat (25) is set to a low level to minimise the patient’s exposure to light hazard.

4. Rotate the joystick (24) until the light beam is at eye level.

5. Holding the joystick vertical, move the slit Lamp base towards the patient until the slit beam appears focused on the patient’s cornea.

6. Adjust slit width (18), magnification (31), slit rotation (13) & slit angle etc. as required to perform the examination.

7. Loosening slit offset centring knob (16) to allow the slit image to be moved off centre for scleral illumination. Tightening the knob will re-centre the slit image in the centre of the visual field of the microscope.

8. The slit image is made vertical, or given a preset angle by means of the illumination latch (17) (notches at 5°, 10° and 15° & 20°).

9. When using the blue filter (12) the user may wish to insert the yellow barrier filter (29). The yellow barrier filter is out when the knob is up, in when it is down.

10. When the examination is complete, set the rheostat to a low level and switch off the Slit Lamp.

Shut down after every use. In case the dust cover is used: risk of overheating.
12 DESCRIPTION OF FILTERS, APERTURES AND MAGNIFICATIONS

STEREO MICROSCOPE

Eyepieces 12.5x
Dioptric adjustment +/- 8D

13 ROUTINE MAINTENANCE

13.1 BULB REPLACEMENT (6V 20W AND 12V 30W SYSTEMS ONLY)

- Disconnect the power cord to the lamp housing and remove the lamp cover on tower illumination systems by loosening the two screws on the lamp housing.
- Carefully disconnect the power leads from the lamp pins by pulling off the connecting plug.
- Loosen and remove the screw holding the lamp retaining clip.
- Remove the burnt out lamp. Be careful it may still be hot!
- Replace it with a new 6V 20W halogen lamp, take care to avoid handling the lamp glass.
- Replace the lamp retaining clip.
- Reconnect the power connections to the lamp.
- Replace the lamp housing or lamp cover.

13.1.1 LED SYSTEMS

LED’s typically have a life exceeding 10,000 hours of continuous use and therefore can be considered as a non-consumable item that will not require changing by a user.

Whilst this is a significant life expectancy we suggest that the Slit Lamp is always switched off between examinations to conserve energy and LED life.

In the unlikely event of an LED failure please contact Keeler or your local distributor for guidance on the replacement procedure.

13.2 REGULARLY INSPECT THE DEVICE FOR DAMAGE OR DIRT

Routinely clean as per section 7 Cleaning Instructions.

13.3 CLEANING AND CHANGING THE MIRROR

The mirror is front surfaced to avoid ghosting of the projected light and therefore is very delicate and will need to be replaced when the surface deteriorates.
The mirror should be cleaned only with a soft clean lens cloth.

The mirror is an interference fit in its holder and can be removed by grasping it firmly and pulling it out of its holder. Slide in the replacement mirror taking care to avoid touching the reflective surface.

Care must be taken to keep the objective and the eyepiece lenses clean – use only soft clean lens cloths to clean optical surfaces.

### 13.4 Electrical Connections

Routinely check all electrical connections, cables and connectors. To access the bulb connections see earlier in this section for guidance.

### 13.5 Optics

The optics should be wiped clean of any loose dirt or debris with a suitable dust brush then cleaned with a soft dry lens cloth, washed linen or other non abrasive lens cleaning material.

The condenser lens beneath the illumination lamp will require cleaning; to access this, remove the lamp as detailed earlier, clean the condenser lens and then replace the lamp.

### 13.6 Axle and Mechanical Parts

If the Slit Lamp becomes hard to move on the glide plate, the plate should be cleaned with a lightly oiled cloth or silicon polish. The axle should be cleaned only with dry lint free cloths.

---

### 14 Warranty = 3 Years

The Keeler H-Series Slit Lamps are guaranteed for three years (3) against faulty workmanship materials or factory assembly. Warranty is on a Return To Base (RTB) basis at the cost of the customer and may be void if the Slit Lamp has not been regularly serviced.

The manufacturers warranty and terms and conditions are detailed on the Keeler UK website [http://www.keeler.co.uk/terms_and_conditions.htm](http://www.keeler.co.uk/terms_and_conditions.htm)

The mirror, main illumination lamp and general ‘wear and tear’ are excluded from our standard warranty.

---

The manufacturer declines any and all responsibility and warranty coverage should the instrument be tampered with in any manner or should routine maintenance be omitted or performed in manners not in accordance with these manufacturer’s instructions.

There are no user serviceable parts in this instrument. Any servicing or repairs should only be carried out by Keeler Ltd. or by suitably trained and authorised distributors. Service manuals will be available to authorised Keeler service centres and Keeler trained service personnel.
15 SPECIFICATIONS AND ELECTRICAL RATINGS

The Keeler Slit Lamp is a medical electrical instrument. The instrument requires special care concerning electromagnetic compatibility (EMC). This Section describes its suitability in terms of electromagnetic compatibility of this instrument. When installing or using this instrument, please read carefully and observe what is described here.

Portable or mobile-type radio frequency communication units may have an adverse effect on this instrument, resulting in malfunctioning.

15.1 ELECTROMAGNETIC EMISSIONS

Guidance and manufacturer’s declaration – electromagnetic emissions

The Keeler Slit Lamp is intended for use in the electromagnetic environment specified below. The customer or user should assure that it is used in such an environment.

</tr>
</tbody>
</table>

**Recommended separation distances between  and mobile RF communications equipment and the Keeler Slit Lamp**

The Keeler Slit Lamp is intended for the use in an electromagnetic environment in which radiated RF disturbances are controlled. The customer or the user of the Keeler Slit Lamp can help prevent electromagnetic interference by maintaining a minimum distance between mobile RF communications equipment (transmitters) and the Keeler Slit Lamp as recommended below, according to the maximum output power of the communications equipment.

<table>
<thead>
<tr>

</tbody>
</table>

For transmitters rated at a maximum output power not listed above, the recommended separation distance d in metres (m) can be determined using the equation applicable to the frequency of the transmitter, where p is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

Note: At 80MHz and 800MHz, the separation distance for the higher frequency applies. These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

---

1. Field strengths from fixed transmitters, such as base stations (cellular / cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the Keeler Slit Lamp is used exceeds the applicable RF compliance level above, the Keeler Slit Lamp should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as re-orientating or relocating the Keeler Slit Lamp.

2. Over the frequency range 150kHz to 80 MHz, field strengths should be less than 3 V/m.

---

**15.4 RECOMMENDED SAFE DISTANCES**

Interference may occur in the vicinity of equipment marked with the this symbol.

DISPOSAL OF OLD ELECTRICAL AND ELECTRONIC EQUIPMENT
(Applicable in the European Union and other European Countries with separate Collection Systems).

This Symbol on the Product or on its Packaging and instructions indicates that it was put on the market place after August 2005 and that this product shall not be treated as Household Waste.

To Reduce the Environmental impact of WEEE (Waste Electrical Electronic Equipment) and minimise the volume of WEEE entering landfills we encourage at Product end of life that this Equipment is recycled and reused.

If you need more information on the collection reuse and recycling then please contact B2B Compliance on 01691 676124 (+44 1691 676124). (UK only).
